1. Suppose your training examples are sentences (sequences of words). Which of the following refers to the  $j^{th}$  word in the  $i^{th}$  training example?

1/1점

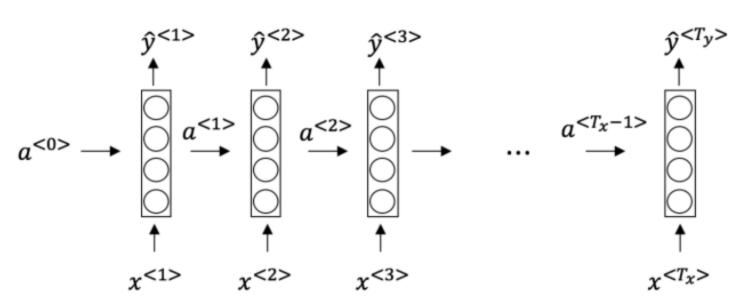

1/1점

1/1점

- $igotimes x^{(i) < j >}$
- $\bigcirc \ x^{< i > (j)}$
- $\bigcirc \ x^{(j) < i>}$
- $\bigcirc \ x^{< j > (i)}$
- ⊘ 맞습니다

We index into the  $i^{th}$  row first to get the  $i^{th}$  training example (represented by parentheses), then the  $j^{th}$  column to get the  $j^{th}$  word (represented by the brackets).

2. Consider this RNN:

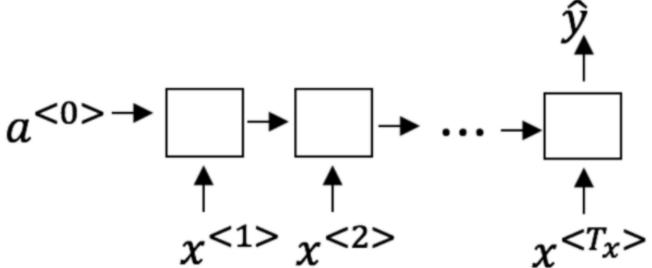

This specific type of architecture is appropriate when:

- $\bullet$   $T_x = T_y$
- $\bigcirc \ T_x < T_y$
- $\bigcap T_x > T_y$
- $\bigcap T_x = 1$
- ⊘ 맞습니다

3. To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

It is appropriate when every input should be matched to an output.

lacktriangle

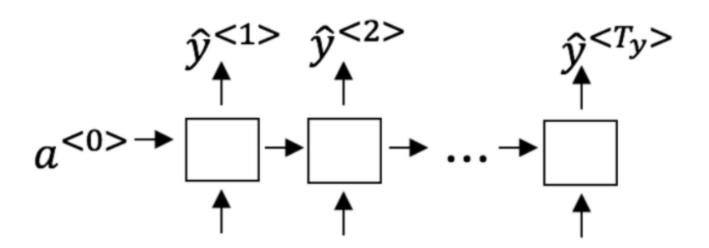

- Speech recognition (input an audio clip and output a transcript)
- Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

- Image classification (input an image and output a label)
- Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)

맞습니다
 Correct!

4. You are training this RNN language model.

1/1점

At the  $t^{th}$  time step, what is the RNN doing? Choose the best answer.

- $\bigcirc \ \, \text{Estimating} \, P(y^{<1>},y^{<2>},\ldots,y^{< t-1>})$
- $\bigcirc \ \ \text{Estimating} \ P(y^{< t>})$
- Estimating  $P\big(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \dots, y^{< t-1>}\big)$
- $\bigcirc \ \, \text{Estimating} \, P\big(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t>} \big)$

#### ⊘ 맞습니다

Yes, in a language model we try to predict the next step based on the knowledge of all prior steps.

5. You have finished training a language model RNN and are using it to sample random sentences, as follows:

What are you doing at each time step t?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ .(ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ .(ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ .(ii) Then pass this selected word to the next time-step.

- **6.** You are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of these is the most likely cause of this problem?
- 1/1점

1/1점

- O Vanishing gradient problem.
- Exploding gradient problem.
- ReLU activation function g(.) used to compute g(z), where z is too large.
- O Sigmoid activation function g(.) used to compute g(z), where z is too large.

7. Suppose you are training a LSTM. You have a 10000 word vocabulary, and are using an LSTM with 100-dimensional activations  $a^{< t>}$ . What is the dimension of  $\Gamma_u$  at each time step?

1/1점

- O 1
- 100
- O 300
- 0 10000
- ⊘ 맞습니다

Correct,  $\Gamma_u$  is a vector of dimension equal to the number of hidden units in the LSTM.

8. Here're the update equations for the GRU.

1/1점

### GRU

$$\tilde{c}^{< t>} = \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[\ c^{< t-1>}, x^{< t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[\ c^{< t-1>}, x^{< t>}] + b_r)$$

$$c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>}$$

$$a^{< t>} = c^{< t>}$$

Alice proposes to simplify the GRU by always removing the  $\Gamma_u$ . I.e., setting  $\Gamma_u$  = 1. Betty proposes to simplify the GRU by removing the  $\Gamma_r$ . I. e., setting  $\Gamma_r$  = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

O Alice's model (removing  $\Gamma_u$ ), because if  $\Gamma_r \approx 0$  for a timestep, the gradient can propagate back through that timestep without much decay.

	O Alice's model (removing $\Gamma_u$ ), because if $\Gamma_r \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.  Betty's model (removing $\Gamma_r$ ), because if $\Gamma_u \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.  Betty's model (removing $\Gamma_r$ ), because if $\Gamma_u \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.  P\$\text{g}\$ \$\mathref{Q}\$ \$\		
9.	Here are the equations for the GRU and the LSTM:	T. CUDA	1/1점
	GRU $\tilde{c}^{} = \tanh(W_c[\Gamma_r * c^{}, x^{}] + b_c)$	LSTM	
	$\Gamma_u = \sigma(W_u[c^{< t-1>}, x^{< t>}] + b_u)$	$\tilde{c}^{< t>} = \tanh(W_c[a^{< t-1>}, x^{< t>}] + b_c)$	
	$\Gamma_r = \sigma(W_r[c^{< t-1>}, x^{< t>}] + b_r)$	$\Gamma_u = \sigma(W_u[a^{< t-1>}, x^{< t>}] + b_u)$ $\Gamma_f = \sigma(W_f[a^{< t-1>}, x^{< t>}] + b_f)$	
	$c^{} = \Gamma_u * \tilde{c}^{} + (1 - \Gamma_u) * c^{}$	$\Gamma_o = \sigma(W_o[a^{< t-1>}, x^{< t>}] + b_o)$	
	$a^{} = c^{}$	$c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>}$	
		$a^{< t>} = \Gamma_o * c^{< t>}$	
	From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to and in the GRU. What should go in the blanks?		
	$lacksquare$ $\Gamma_u$ and $1-\Gamma_u$		
	$\bigcap$ $\Gamma_u$ and $\Gamma_r$		
	$\bigcap$ $1-\Gamma_u$ and $\Gamma_u$		
	$igcap \Gamma_r$ and $\Gamma_u$		
	맞습니다     Yes, correct!		
10	<b>10.</b> You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as $x^{<1>},\ldots,x^{<365>}$ . You've also collected data on your dog's mood, which you represent as $y^{<1>},\ldots,y^{<365>}$ . You'd like to build a model to map from $x\to y$ . Should you use a Unidirectional RNN or Bidirectional RNN for this problem?		
	O Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.		
	Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.		
	$\bigcirc$ Unidirectional RNN, because the value of $y^{< t>}$ depends only on $x^{< 1>}, \ldots, x^{< t>}$ , but not on $x^{< t+1>}, \ldots, x^{< 365>}$		

O Unidirectional RNN, because the value of  $y^{< t>}$  depends only on  $x^{< t>}$ , and not other days' weather.

맞습니다
 Yes!
