(We used Fahrenheit in lecture, so will use Celsius here in honor of the metric world.)

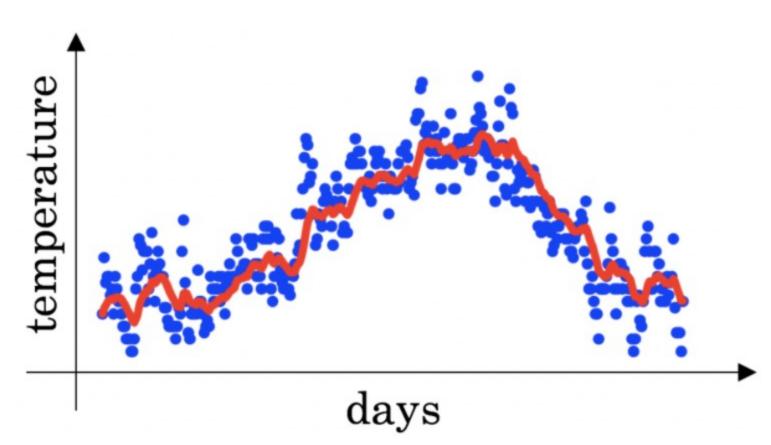

Say you use an exponentially weighted average with  $\beta=0.5$  to track the temperature:  $v_0=0$ ,  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . If  $v_2$  is the value computed after day 2 without bias correction, and  $v_2^{corrected}$  is the value you compute with bias correction. What are these values? (You might be able to do this without a calculator, but you don't actually need one. Remember what bias correction is doing.)

- $igotimes v_2 = 7.5$  ,  $v_2^{corrected} = 10$
- $\bigcirc \ v_2=10, v_2^{corrected}=7.5$
- $\bigcirc \ v_2=10, v_2^{corrected}=10$
- $\bigcirc \ v_2 = 7.5, v_2^{corrected} = 7.5$

- 6. Which of these is NOT a good learning rate decay scheme? Here, t is the epoch number.

1/1점

- $\bigcirc \ \alpha = 0.95^t \alpha_0$
- $\bigcirc \ \alpha = \frac{1}{1+2*t}\alpha_0$
- $\bigcap \alpha = \frac{1}{\sqrt{t}}\alpha_0$

- 7. You use an exponentially weighted average on the London temperature dataset. You use the following to track the temperature:  $v_t = \beta v_{t-1} + (1-\beta)\theta_t$ . The red line below was computed using  $\beta = 0.9$ . What would happen to your red curve as you vary  $\beta$ ? (Check the two that apply)

1/1점

- $\hfill \square$  Decreasing  $\beta$  will shift the red line slightly to the right.
- $\hfill \square$  Increasing  $\beta$  will shift the red line slightly to the right.
- ⊘ 맞습니다

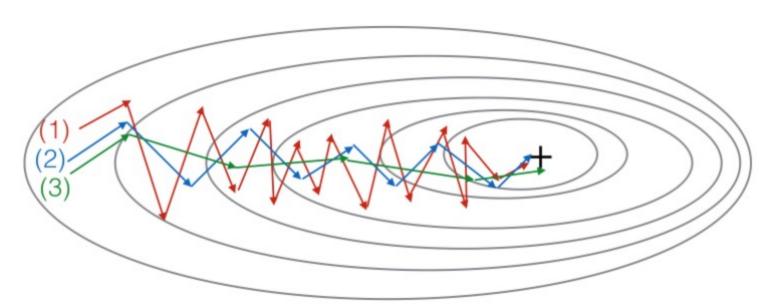

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a green line \$\$\beta=0.98\$) that is slightly shifted to the right.

- $\hfill \square$  Decreasing  $\beta$  will create more oscillation within the red line.
- ⊘ 맞습니다

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a yellow line \$\$\beta=0.98\$ that had a lot of oscillations.

- $\hfill \square$  Increasing  $\beta$  will create more oscillations within the red line.
- 8. Consider this figure:

1/1점

These plots were generated with gradient descent; with gradient descent with momentum ( $\beta$  = 0.5) and gradient descent with momentum ( $\beta$  = 0.9). Which curve corresponds to which algorithm?

- (1) is gradient descent. (2) is gradient descent with momentum (large  $\beta$ ) . (3) is gradient descent with momentum (small  $\beta$ )
- (1) is gradient descent. (2) is gradient descent with momentum (small  $\beta$ ). (3) is gradient descent with momentum (large  $\beta$ )
- (1) is gradient descent with momentum (small  $\beta$ ). (2) is gradient descent. (3) is gradient descent with momentum (large  $\beta$ )
- (1) is gradient descent with momentum (small  $\beta$ ), (2) is gradient descent with momentum (small  $\beta$ ), (3) is gradient descent

9.	Suppose batch gradient descent in a deep network is taking excessively long to find a value of the parameters that achieves a small value for the cost function $\mathcal{J}(W^{[1]},b^{[1]},,W^{[L]},b^{[L]})$ . Which of the following techniques could help find parameter values that attain a small value for $\mathcal{J}$ ? (Check all that apply)	1/1점
	igstar Try tuning the learning rate $lpha$	
	◇ 맞습니다	
	Try initializing all the weights to zero	
	✓ Try using Adam	
	⊘ 맞습니다	
	✓ Try mini-batch gradient descent	
	◇ 맞습니다	
	✓ Try better random initialization for the weights	
	◇ 맞습니다	
10	Which of the following statements about Adam is False?	1/1점
	igcup The learning rate hyperparameter $lpha$ in Adam usually needs to be tuned.	
	O We usually use "default" values for the hyperparameters $\beta_1,\beta_2$ and $\varepsilon$ in Adam ( $\beta_1=0.9,\beta_2=0.999,\varepsilon=10^{-8}$ )	
	Adam should be used with batch gradient computations, not with mini-batches.	
	Adam combines the advantages of RMSProp and momentum
